

C profiles are used for forming metal bearing framework at internal section wall, space curtain wall and shaft wall applications. It is applied with instating between wall U profiles. During section wall construction, gypsum plate is screwed to both sides of profiles with instating between wall U profiles, and to single side for curtain wall construction.

It is made up of hot dip galvanized 0,45; 0,50 and 0,60 mm thick carbon steel sheets by means cold forming method in order to prevent corrosion. There are lengthwise channels in order to maintain strength. Its surface is perforated for maintaining installation easiness. Complies with TS EN 14195 (Metal Framework Components, Used on Gypsum Plate Systems) standard.

	Thickness (mm)	Weight (kg/m)	Width (mm)	Flange (mm)	Length (mm)
